

Dr. Nolan Lee:

The technology is two components. It's electrical and chemical. It's a very advanced equipment that comes out of Germany that we use, that uses quantum theory to stimulate cells. The machine actually communicates to nerve cells and basically tells them how to heal and get better. Then what we do is combine a vitamin infusion into the areas of nerve damage. This vitamin infusion is a lot of nerve supportive substances, a lot of the things based on B vitamins that support nerve function and repair. Then we put this equipment on that tells those nerve cells to repair. At the same time, the machine treats some of the side effects, let's say, of neuropathy. It increases blood flow and reduces all that swelling in there too at the same time. Combined effects of getting that swelling down helps alleviate some of the pain and dysfunction. Then a more long-term benefit is the healing of those nerve fibers that we can see actually, with biopsies, a difference before and after treatment.
